Executive Insights

1. Sales & Monthly Performance

August: Highest Revenue with Moderate Order Volume

August recorded the **highest revenue**, despite not having the highest number of orders. This suggests that the strong performance was driven by a **higher average order value** rather than order volume alone.

Recommendation:

Analyze the sales mix and customer behavior in August to identify the products, order types, and factors that contributed to the higher revenue, and consider replicating these factors in other months.

April: Lower Order Volume

April showed a noticeable decline in the **number of orders**, which affected the overall sales performance.

Recommendation:

Investigate the reasons behind the decline in April, such as customer demand, promotions, seasonality, or order channels, and develop targeted campaigns to increase order volume during similar periods.

January: Lowest Sales Performance

January recorded the **lowest sales performance** among the analyzed months.

Recommendation:

Compare January's product mix, order volume, average receipt, and order types with stronger months to identify the main factors behind the lower revenue.

2. Category Performance

Burgers & Meals Are the Main Revenue Drivers

Burgers and Meals generated the highest revenue among the categories.

This can be explained by the combination of **strong demand and relatively high selling prices**. Meals also contain several items with higher prices, particularly family-oriented meals, which contributes significantly to total revenue.

Recommendation:

Continue prioritizing Burgers and Meals in promotions and bundles while monitoring their profitability and customer demand.

Categories Exceeding the Average Price Target

Burgers, Meals, Chicken, and Local Favorites exceeded the defined **average selling price target**.

This indicates that these categories have a relatively strong contribution to revenue due to their higher average selling prices.

Recommendation:

Maintain these categories as key revenue drivers while using lower-priced products to attract customers and increase order frequency.

3. Branch Performance

Top-Performing Branch

The highest-revenue branch also records a **high number of orders**, particularly during stronger periods such as **October, November, and the summer season**.

This suggests that its strong revenue performance is largely supported by **high order volume**.

Recommendation:

Analyze this branch's successful practices—especially its order volume, delivery performance, and seasonal demand—and consider applying similar strategies to other branches.

6th of October Branch: High Revenue Despite Lower Order Volume

The **6th of October branch** is particularly interesting because it generates strong revenue despite having a relatively lower number of orders.

This suggests that its performance may be driven by a **higher average order value** rather than order volume.

Business Insight:

This could potentially make the branch more efficient in terms of revenue generated per order.

Recommendation:

Investigate the branch's product mix, average receipt, and customer behavior to understand what drives its high-value orders.

Faisal Branch: Good Ratings but Lower Order Volume

The Faisal branch has an average rating of approximately **3.8**, which is reasonably close to the overall average rating of around **4**.

Therefore, customer ratings do not appear to be the primary issue. The lower revenue is more likely related to its **lower order volume**.

Recommendation:

Focus on increasing order frequency through **delivery promotions, faster delivery, and stronger local marketing**, rather than focusing heavily on improving ratings.

Tanta Branch: High Orders but Lower Revenue

Tanta is one of the branches with a **high number of orders**, but its revenue is relatively lower.

The main explanation is the **lower average receipt value**.

Customers may be purchasing lower-priced products such as **drinks and Kids Meals**, resulting in many transactions but relatively lower revenue per transaction.

Business Insight:

Tanta demonstrates that **high order volume does not necessarily mean high revenue**.

Recommendation:

Introduce bundles and upselling strategies to increase the average receipt while maintaining the existing high order volume.

Zamalek Branch: Strong Opportunity to Increase Orders

The Zamalek branch has strong potential, but its performance can be improved by increasing its **order volume**, particularly through delivery.

This becomes more important during the restaurant's peak hours.

Recommendation:

Strengthen delivery operations and local marketing in Zamalek to increase order volume without negatively affecting service quality.

4. Peak Hours & Operations

Peak Hours: 3 PM – 9 PM

The analysis shows that the highest order activity occurs approximately between **3 PM and 9 PM**.

During these peak hours, order volume can reach **more than 1,000 orders**.

Recommendation:

Increase staffing and operational capacity during peak hours to reduce waiting times, maintain service quality, and prevent delays from negatively affecting customer experience.

Key business idea:

Don't simply increase staff throughout the whole day. **Allocate more resources specifically to peak hours**, where the demand is highest.

5. Payment Method Performance

Mobile Wallet Adoption Is Relatively Low

Cash and Card are significantly more popular payment methods than **Mobile Wallet**.

This indicates that customers may either be less familiar with the wallet option or prefer traditional payment methods.

Recommendation:

Increase awareness and adoption of Mobile Wallet payments through **targeted promotions, discounts, or loyalty incentives**, especially if the restaurant wants to reduce dependence on cash transactions.

6. Key Strategic Takeaways

1. Revenue is not driven by order volume alone

August and the 6th of October branch demonstrate that **higher average order value can compensate for lower order volume.**

2. High order volume does not always mean high revenue

Tanta has a high number of orders but relatively lower revenue because of its **lower average receipt value.**

3. Burgers and Meals are the strongest revenue drivers

These categories combine strong demand with relatively high selling prices, making them important contributors to total revenue.

4. Peak-hour capacity is critical

The **3 PM–9 PM** period represents the highest demand, making staffing and delivery efficiency during these hours essential.

5. Branch strategies should be different

There is no single solution for every branch:

- **High orders + high revenue** → maintain performance.
- **Low orders + high revenue** → increase order volume.
- **High orders + low revenue** → increase average receipt.
- **Low orders + low revenue** → focus on demand generation and delivery.
